BEGINNER'S GUIDES

How to Configure Wi-Fi on Raspberry Pi? (6 Easy Ways)

All recent Raspberry Pi models include a wireless connection, but the configuration is not always easy, especially if you don't have a graphic interface or need to set up an advanced Wi-Fi configuration. Don't worry, I'll explain everything with simple steps in this tutorial.

The easiest way to set up Wi-Fi on a Raspberry Pi is to do it directly in the advanced options of Raspberry Pi Imager when installing the system. If the system is already installed, the [GUI](#) and `raspi-config` offer intuitive interfaces too.

I'll show you everything in this post. There are several solutions available depending on your system version and access to it. I have put them in order of most recommended / simple to most advanced, so feel free to jump directly to the part you are looking for.

The following chapters include projects you can try on your own.

Recommended: Use Raspberry Pi Imager

The easiest way currently to set up your Wi-Fi connection before the first boot is to use Raspberry Pi Imager. This tool includes advanced settings where you can set up a few things including the wireless network you want to use.

- Download and install Raspberry Pi Imager on your computer.

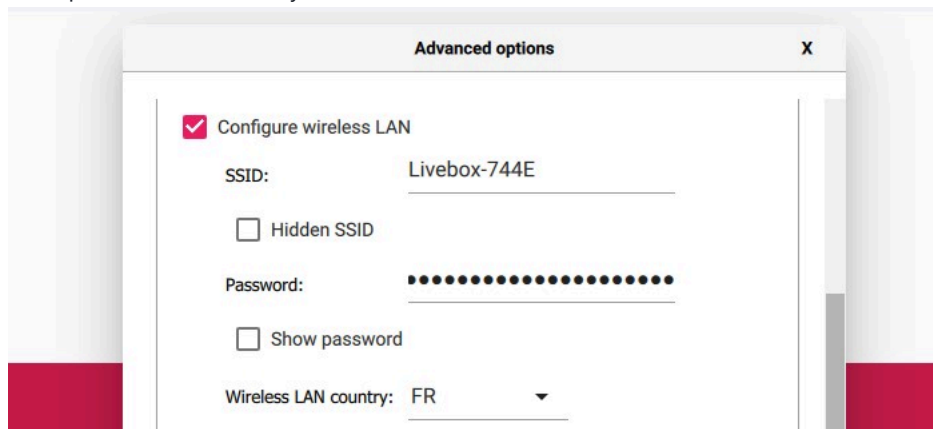

If you don't have it yet, you can get it for free from the official website. It's available for Windows, Linux, and even for Raspberry Pi OS.

- **Use Raspberry Pi Imager's advanced options.**

Select the operating system you want to use (let's say Raspberry Pi OS) and your storage device (SD card or USB). Then click on the settings icon in the bottom right to open the advanced options:

- In this form, you can enable [SSH](#), set the username and password, and also configure your Wi-Fi connection. Fill in the SSID, password and country, then click on "Save".

- **Click on the "Write" button to start the installation.** Your settings will be included on the media.

Raspberry Pi Imager or want to do the same thing manually.

If you are using this tool for the first time, please take a look at [my complete guide about Raspberry Pi Imager here](#). I explain everything in more detail and give you many advanced tips.

Configure Wi-Fi on Raspberry Pi OS Desktop

Now, if the system is already installed, or you didn't use the Raspberry Pi Imager options, here are two ways to do it on Raspberry Pi OS with a desktop interface.

Via the welcome wizard

If it's your first boot and you haven't configured anything via Raspberry Pi Imager or other methods, **you should get a "Welcome to Raspberry Pi" wizard asking you to configure a few things on your system.**

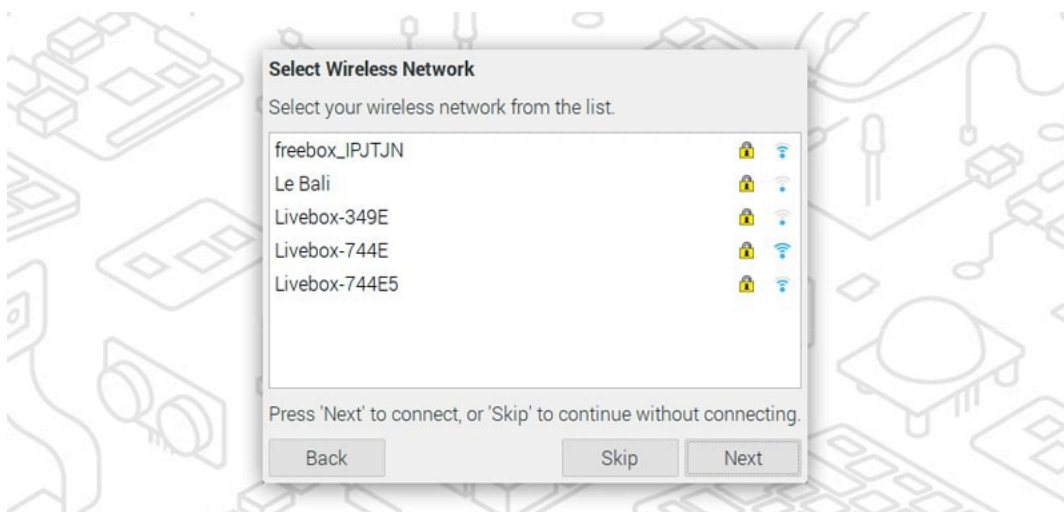

It's the easiest way to configure the Wi-Fi on a brand new Raspberry Pi OS with Desktop, so don't miss this menu. You'll be asked to configure the country, keyboard layout and create a new user.

Then you'll get a window like this to select a wireless network:

Download the Pi Glossary!

If you are lost in all these new words and abbreviations, request my free Raspberry Pi glossary here (PDF format)!

Download now

Select your Wi-Fi network SSID in the list, click "Next" and type the password in the following screen:

Every Raspberry Pi User's Secret? This Downloadable Linux Command Cheat Sheet!

Grab Yours Here!

A few seconds later, the Raspberry Pi will be connected to your Wi-Fi.

Via the menu in the top bar

If you missed the welcome wizard or skipped the Wi-Fi configuration here, **you can do it or change it at any time from the taskbar panel:**

At the top of your screen, you have the main panel with the menu, shortcuts, and the clock.

[Learn more](#)

- **Near the clock, there is a network symbol** (with two red crosses if you are disconnected, or two blue arrows if you're connected via Ethernet).
- **Click on it** and a list of all available wireless networks appears.

- **Select your network** in the list and type your password.

That's it, you should be connected instantly. It's not very complicated either 😊

Set up your Wi-Fi on Raspberry Pi OS Lite

If you're on Raspberry Pi OS Lite, you may need more help to find out how to configure your network. Let's see two methods to do this (the first one is recommended).

Using the raspi-config tool

Every Raspberry Pi User's Secret? This Downloadable Linux Command Cheat Sheet!

Grab Yours Here!

This tool is named "raspi-config" and it's available by default on Raspberry Pi OS Lite:

- **Start raspi-config** with:

```
sudo raspi-config
```

Raspberry Pi Software Configuration Tool (raspi-config)	
1 System Options	Configure system settings
2 Display Options	Configure display settings
3 Interface Options	Configure connections to peripherals
4 Performance Options	Configure performance settings
5 Localisation Options	Configure language and regional settings
6 Advanced Options	Configure advanced settings
8 Update	Update this tool to the latest version
9 About raspi-config	Information about this configuration tool

- **Go into System Options > Wireless LAN.**

Raspberry Pi Software Configuration Tool (raspi-config)	
S1 Wireless LAN	Enter SSID and passphrase
S2 Audio	Select audio out through HDMI or 3.5mm jack
S3 Password	Change password for the 'pi' user
S4 Hostname	Set name for this computer on a network
S5 Boot / Auto Login	Select boot into desktop or to command line
S6 Network at Boot	Select wait for network connection on boot
S7 Splash Screen	Choose graphical splash screen or text boot
S8 Power LED	Set behaviour of power LED

- **Type your SSID and your password.**

Please enter SSID

- **Exit** the tool.
After a few seconds, your Pi is now connected to the wireless network you chose.

That's an easy way to configure Wi-Fi on Raspberry Pi OS Lite.

Are you a bit lost in the Linux command line? [Check this article first](#) for the most important commands to remember and a free downloadable cheat sheet so you can have the commands at your fingertips.

Manual configuration

If for any reason, raspi-config is not an option for you, there are other tools you can try.

Raspberry Pi OS Bookworm

Since Raspberry Pi OS Bookworm, wpa_supplicant is no longer used. The good news is that there is a tool to do the manual configuration, so it's easier overall:

Download the Pi Glossary!

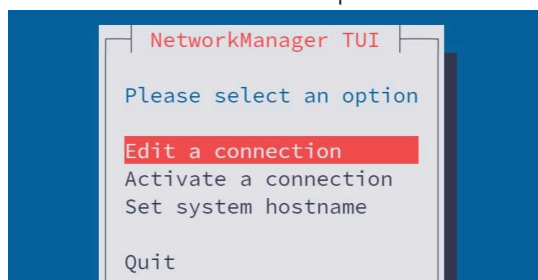

If you are lost in all these new words and abbreviations, request my free Raspberry Pi glossary here (PDF format)!

[Download now](#)

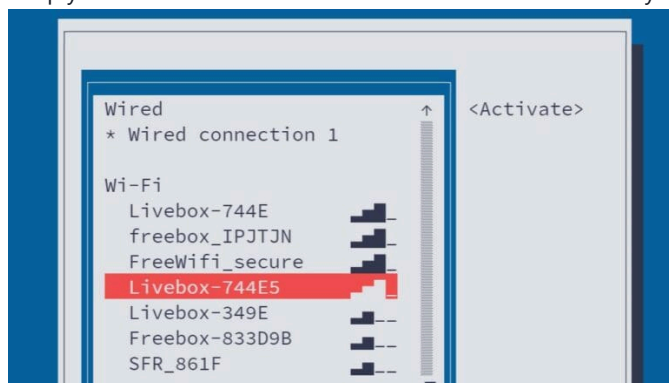

- Run this command to start the tool:

```
sudo nmtui
```

- A window like this one shows up:

- Simply use the wizard to "Activate a connection" and access your Wi-Fi network:

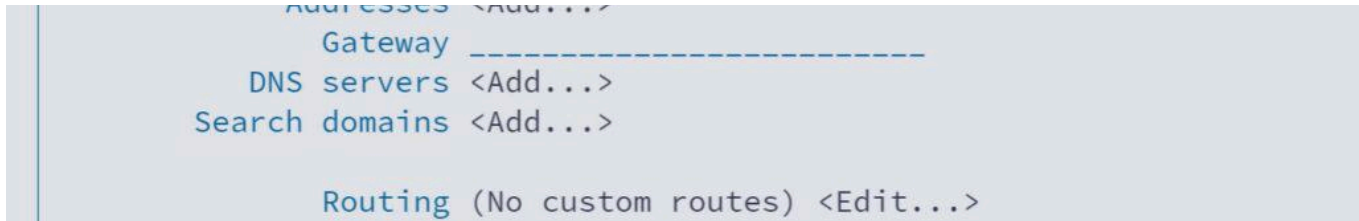

Once a connection added (like the Wi-Fi network in my example), you can choose "Edit a connection" to change the security, password or set a static [IP address](#).

Every Raspberry Pi User's Secret? This Downloadable Linux Command Cheat Sheet!

Grab Yours Here!

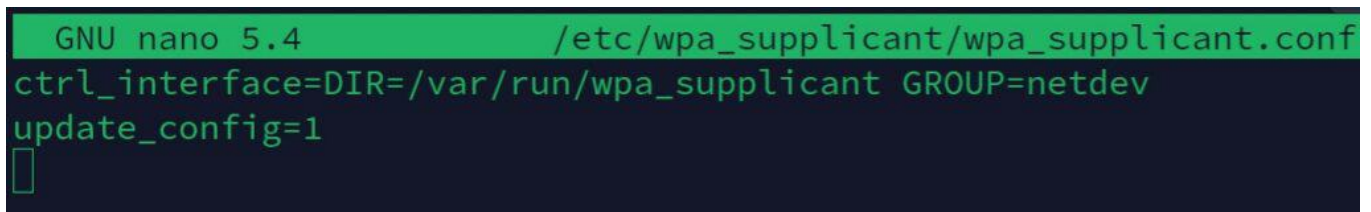

Raspberry Pi OS Bullseye and previous versions

Anyway, **the wireless configuration on the Raspberry Pi is located in /etc/wpa_supplicant.**

You can edit the configuration file with nano:

```
sudo nano /etc/wpa_supplicant/wpa_supplicant.conf
```

By default, the file is almost empty:

You'll need to add a few lines with the network configuration and the country (mandatory).

In the end, you should have something like this:

```
country=US
ctrl_interface=DIR=/var/run/wpa_supplicant GROUP=netdev
update_config=1
network={
    ssid="YOURSSID"
    scan_ssid=1
    psk="YOURPASSWORD"
    key_mgmt=WPA-PSK
}
```

Please don't hesitate to copy and paste these lines in place of the existing ones. For a standard WPA-PSK configuration, you just need to replace the SSID and password.

If the new configuration doesn't work after a few minutes, **you may need to restart the Raspberry Pi:**

```
sudo reboot
```

You can find [many examples here](#) to adapt the configuration to your network (if you use WEP, EAP, or any other security options).

And if you also need to [set up a static IP address on your Raspberry Pi](#), you can click on the link to my other tutorial where I explain all the steps (scroll to the end of the article for the method with command lines).

Download now

The hard way: Headless + Manual configuration

I call this "headless" because it's the method to use when you don't have a screen on your Raspberry Pi. But **you can absolutely use it in any case**. Besides, that's what I was doing most of the time (before Imager advanced options).

For a one-time installation, the easiest option for headless Wi-Fi configuration is now to use Raspberry Pi Imager, but if for any reason you want to do it manually, here is the full procedure with wpa supplicant.

This solution doesn't work anymore with Raspberry Pi OS Bookworm, use Raspberry Pi Imager.

The idea is to add a new file on the SD card (or USB drive) that will include the Wi-Fi configuration. This file is named "wpa_supplicant.conf" and will include the same lines as in the manual configuration I explained earlier (for RPI OS Lite).

Here are the steps to create this file:

- **Open your favorite text editor** on your computer.
The basic editor from your operating system will be fine (Notepad for example).
- **Copy and paste these lines** into it:

```
country=US
ctrl_interface=DIR=/var/run/wpa_supplicant GROUP=netdev
update_config=1
network={
    ssid="YOURSSID"
    scan_ssid=1
    psk="YOURPASSWORD"
    key_mgmt=WPA-PSK
}
```

- **Replace the variables with your SSID and password** and change the country value if needed.
This is the configuration for a standard WPA-PSK wireless network, [check the documentation](#) for more advanced options.
- **Save the file** to a location you can find easily the next time you create a new SD card.

Insert your SD card into your computer (you may need to eject it and re-insert it if you just flashed it). Then **copy the wpa_supplicant.conf file to the boot partition**.

Note: If you don't have an SD card reader on your computer, you can get a cheap USB to SD card adapter on Amazon ([this one, for example](#)).

Every Raspberry Pi User's Secret? This Downloadable Linux Command Cheat Sheet!

Grab Yours Here!

Bonus tip: Enable SSH automatically.

Another thing you may want to do if you really use your Raspberry Pi without a screen is to enable the SSH service automatically. On Raspberry Pi OS, SSH is disabled by default.

To enable it automatically there is another file to create.

Just **create an empty file named “ssh” into the same partition (boot).**

That's enough to tell Raspberry Pi OS to start the SSH service automatically on boot.

It's something I use all the time, and I explained it in more detail in this tutorial on how to install a Raspberry Pi without a [screen and keyboard](#).

Going further

That's it, you now know different ways to set up the Wi-Fi on your Raspberry Pi, whatever the system version you use or your network complexity.

As a general rule, I would recommend using the advanced options in Raspberry Pi imager when possible, but you have discovered many other solutions to suit each situation. You learned a lot today!

I run Motioneye on my PI, I have recently changed my home router, now the PI cannot log in because the router and password info is incorrect. I am unable to get to the command screen as Motioneye starts up on boot? how do I now change the router info please?

Patrick Fromaget says:

March 10, 2020 at 1:30 pm

Hi Ken,

I suppose you want to say "motionEyeOS"

I don't know this OS, but in the wiki, they say that the configuration is in the wpa_supplicant.conf file, maybe /data/etc/wpa_supplicant.conf

If you find it, you can edit the file with the default editor and update your settings
